

# PROSPECT

Do you or someone you know have Parkinson's disease and are interested in clinical research?

## **PROSPECT: A Parkinson's disease observational study**

PROSPECT is an observational study to understand the clinical outcomes in Parkinson's disease. Your participation will help researchers and health care providers better understand the impact of Parkinson's disease symptoms on your life and, ultimately, help to improve standard of care practices.

### **Study participants must meet the following criteria to participate:**

- Parkinson's disease that is responsive to levodopa
- Experiencing at least 2.5 hours of "off" time per day despite use of oral medication
  - "Off" time refers to periods of the day where you experience symptoms such as slowness, stiffness, muscle tightness, etc.
- >30 years of age
- Not currently receiving deep brain stimulation or carbidopa/levodopa enteral suspension
- Speak with your HCP to understand additional eligibility criteria

**Talk to your health care provider about ongoing clinical trials and whether the PROSPECT (H20-012) study is right for you.**
